

Ceedo for Citrix®

Deploy plug-and-play, sand-boxed workspaces with Citrix Receiver, Public Key middleware, an independent browser, and policies - hosted on Two Factor Authentication devices.

Organizations that use Citrix XenApp or XenDesktop, often provide their employees with the ability to access their Citrix applications from unmanaged computers using Citrix Receiver. However, ensuring a consistent security level beyond organizational boundaries also compels IT departments to deploy Public Key Identification (PKI) solutions for Certificate-Based Two Factor Authentication (CBA/2FA) using either smartcard chips on USB devices and sometimes in pure software mode.

Once all the different solutions are in place, it is usually left up to the end-users to install all the various components on their unmanaged PCs. The required components include: the Citrix Receiver, 2FA/PKI middleware, adding a self-signed certificate to the browser, and additional plug-ins such as VPN SSL add-ons that might be used by the organizational portal (such as specific .Net Framework and Java versions).

Installing and configuring all the different components might prove to be a daunting task, especially for non-savvy users, incurring high help-desk costs, management overhead, and an endless list of potential software conflicts, security risks, data leakage, and more.

Using **Ceedo for Citrix**, IT departments can offer a centrally-managed self-contained workspace, hosted on a Two-Factor Authentication device or USB portable drive, with a pre-configured sandboxed environment, that includes all the different components and applications in a ready-to-run mode, requiring zero installation, free of potential conflicts, and without requiring any additional effort from the user.

Benefits

Self-Contained

A complete workspace including the Receiver, a sandboxed browser, configurations, plug-ins and additional software.

Plug-and-Play

Runs entirely from the portable device with nothing installed on the PC – just plug and play!

Strong Authentication

Integrates seamlessly with hardware-based CBA-2FA PKI devices.

Data Security

Hosted in a read-only partition, preventing tampering and data leakage.

Zero Footprint

Data and applications remain on the device. When unplugged, everything shuts down automatically, leaving no trace on the host PC.

Central Management

Includes a complete suite for remote provisioning, updating and web-based user management.
